| Bead original coordinates(in pixels) |                      | 743.0, 233.0            |          |            |                   |                     |

### Warnings:

(No saturated pixels detected). (All channels sampled following Shannon-Nyquist criterion). (A subresolution bead is used for all channels).

### Resolution table:

| Channel                 | Sig/Backgnd ratio | Dimension | Measured FWHM (μm) | theory (μm) | Fit Goodness | Mes./theory ratio |
|-------------------------|-------------------|-----------|--------------------|-------------|--------------|-------------------|
| Channel 0 (em. 440.0nm) | 15.5              | X         | 0.229              | 0.16        | 1.0          | 1.43              |
|                         |                   | Y         | 0.263              | 0.16        | 1.0          | 1.64              |
|                         |                   | Z         | 0.582              | 0.603       | 0.99         | 0.97              |

Green: within specifications, red: outside specifications (ie. XY ratios above 1.5 or Z ratio above 2.0)

### Lateral asymmetry ratios:

| Channel                 | Ratio |
|-------------------------|-------|
| Channel 0 (em. 440.0nm) | 0.87  |

Detailed channel detection info:

Channel #0

| Channel 0 (em. 440.0nm) |      |           |       |              |
|-------------------------|------|-----------|-------|--------------|
| Sig./Backgnd ratio      | LAR  | Dimension | FWHM  | Fit goodness |
| 15.5                    | 0.87 | X         | 0.229 | 1.0          |
|                         |      | Y         | 0.263 | 1.0          |
|                         |      | Z         | 0.582 | 0.99         |

| Image 9_bead5 | 2024-10-17 10:22:24 | none       | correct          | analysed |

### Formulas used:

Lateral ( $res_{x,y}^o$ ) and axial ( $res_z^o$ ) theoretical resolution values used for widefield microscopes are calculated as defined in Wilhelm, S. Confocal Laser Scanning Microscopy, 2011:

$$res_{x,y}^o = \frac{0.51 \cdot \lambda_{em}}{NA} \quad res_z^o = \frac{1.77 n \cdot \lambda_{em}}{NA^2}$$

NA: numerical aperture,  $\lambda_{em}$ : emission wavelength, n: refractive index of the lens immersion & mounting media.

Axis profiles are fitted using ImageJ Gaussian Curve Fitter and the following formula  $y = a + (b - a) * e^{\frac{-(x-c)^2}{2d^2}}$  (Gaussian fitting).

Measured lateral and axial resolution (Full Width at Half Maximum, FWHM) values are derived using  $FWHM = 2d\sqrt{2\ln(2)}$

Compliance with the Shannon-Nyquist criterion uses the following formulas for Shannon-Nyquist distances calculation:

$$\alpha = \arcsin\left(\frac{NA}{n}\right)$$

$$\Delta_{x,y} = \frac{\lambda_{em}}{4 \cdot NA} \quad \Delta_z = \frac{\lambda_{em}}{2 \cdot n \cdot (1 - \cos(\alpha))}$$
