

63X_1_2_525

Microscope info:

Image		GreenBeads63x.lif-Series004_bead213				
image's creation	date	2024-10-26 09:47:32				
	method used	from file creation date				
Actual image depth		12				
Microscope type		WideField				
Objective	NA	1.2				
	im. refractive index	1.333				
Channel(s)		Wavelengths		Saturation	sampling (X,Y,Z)	
		Ex. (nm)	Em. (nm)		Nyquist (μm)	Nyquist/found ratio
Channel 0			525.0	none	0.109x0.109x0.349	0.103x0.103x0.099
Bead original coordinates(in pixels)		1557.0, 1464.0				

Warnings:

(No saturated pixels detected). (All channels sampled following Shannon-Nyquist criterion). (A subresolution bead is used for all channels).

Resolution table:

Channel	Sig/Backgnd ratio	Dimension	Measured FWHM (μm)	theory (μm)	Fit Goodness	Mes./theory ratio
Channel 0 (em. 525.0nm)	1.7	X	0.285	0.223	0.99	1.28
		Y	0.283	0.223	0.99	1.27
		Z	0.903	0.86	0.99	1.05

Green: within specifications, red: outside specifications (ie. XY ratios above 1.5 or Z ratio above 2.0)

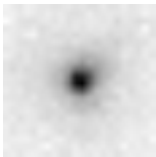

Lateral asymmetry ratios:

Channel	Ratio
Channel 0 (em. 525.0nm)	0.99

Detailed channel detection info:

Channel #0

XY

YZ

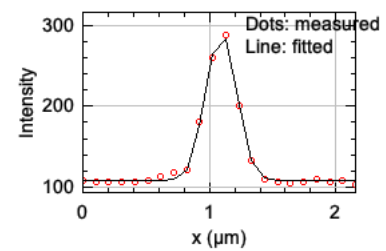

XZ

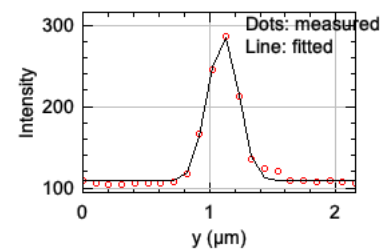

Channel 0 (em. 525.0nm)				
Sig./Backgnd ratio	LAR	Dimension	FWHM	Fit goodness
1.7	0.99	X	0.285	0.99
		Y	0.283	0.99
		Z	0.903	0.99

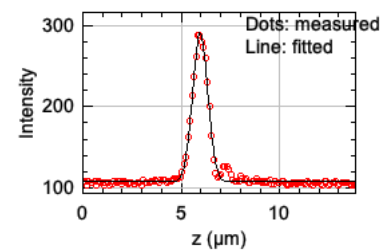

X profile & fitting parameters:
Fit equation $I(x) = a + (b-a) \cdot \exp(-(x-c)/(2 \cdot d))$
Sum of residuals squared: 234.25329
Standard deviation: 3.33990
R²: 0.99585
Parameters:
a = 107.76179
b = 290.02604
c = 1.09325
d = 0.12113

Y profile & fitting parameters:
Fit equation $I(y) = a + (b-a) \cdot \exp(-(y-c)/(2 \cdot d))$
Sum of residuals squared: 387.62604
Standard deviation: 4.29632
R²: 0.99277
Parameters:
a = 108.50010
b = 286.27914
c = 1.10911
d = 0.12021

Z profile & fitting parameters:
Fit equation $I(z) = a + (b-a) \cdot \exp(-(z-c)/(2 \cdot d))$
Sum of residuals squared: 2621.11154
Standard deviation: 4.32692
R²: 0.98766
Parameters:
a = 107.61380
b = 291.51569
c = 5.95654
d = 0.38361

	Type of saved data	.pdf, .jpg, .xls
	Input data bit depth	12
Dimension order		XY-(C)Z
Discard saturated samples		true
Beads	Bead detection threshold	Legacy
	Center detection method	Legacy Maximum Intensity
	Discard bead if more than one particle are thresholded	true
	Background annulus thickness in μm	0.5
	Background annulus distance to bead edges in μm	0.5
	Multiple beads in image	true
	Bead identification method	Using Find Maxima (prominence of 50.0)
	Bead size (μm)	0.1
	Bead crop Factor	5.0
	Cropped ROI size in μm	2.31x2.31 (using bead size & background annulus parameters)
	Bead rejection distance to top/bottom	2.0 μm
Square Root PSF Image displayed		true
Tolerance	Applied in this report	true
	X & Y FWHM ratios valid if below	1.5
	Z FWHM ratio valid if below	2.0

Formulas used:

Lateral ($res_{x,y}^o$) and axial (res_z^o) theoretical resolution values used for widefield microscopes are calculated as defined in Wilhelm, S. Confocal Laser Scanning Microscopy, 2011:

$$res_{x,y}^o = \frac{0.51 \cdot \lambda_{em}}{NA} \quad res_z^o = \frac{1.77 n \cdot \lambda_{em}}{NA^2}$$

NA: numerical aperture, λ_{em} : emission wavelength, n: refractive index of the lens immersion & mounting media.

Axis profiles are fitted using ImageJ Gaussian Curve Fitter and the following formula $y = a + (b - a) * e^{\frac{-(x-c)^2}{2d^2}}$ (Gaussian fitting).

Measured lateral and axial resolution (Full Width at Half Maximum, FWHM) values are derived using $FWHM = 2d\sqrt{2\ln(2)}$

Compliance with the Shannon-Nyquist criterion uses the following formulas for Shannon-Nyquist distances calculation:

$$\alpha = \arcsin\left(\frac{NA}{n}\right)$$

$$\Delta_{x,y} = \frac{\lambda_{em}}{4 \cdot NA} \quad \Delta_z = \frac{\lambda_{em}}{2 \cdot n \cdot (1 - \cos(\alpha))}$$
