Microscope info:

Image		GreenBeads63x.lif-Series004_bead427			
image's creation	date	2024-10-26 09:47:32			
	method used	from file creation date			
Actual image depth		12			
Microscope type		WideField			
Objective	NA	1.2			
	im. refractive index	1.333			
Channel(s)		Wavelengths		Saturation	sampling (X,Y,Z)
		Ex. (nm)	Em. (nm)		Nyquist (µm) / Found (µm) / Nyquist/found ratio

Channel(s)		Wavelengths		Saturation	sampling (X,Y,Z)		
		Ex. (nm)	Em. (nm)		Nyquist (µm)	Found (µm)	Nyquist/found ratio
Channel 0			525.0	none	0.109x0.109x0.349	0.103x0.103x0.099	0.9, 0.9, 0.3
Bead original coordinates(in pixels)		189.0, 567.0					

Warnings:

(No saturated pixels detected). (All channels sampled following Shannon-Nyquist criterion). (A subresolution bead is used for all channels).

Resolution table:

Channel	Sig/Backgnd ratio	Dimension	Measured FWHM (µm)	theory (µm)	Fit Goodness	Mes./theory ratio
Channel 0 (em. 525.0nm)	<0.1	X	0.053	0.223	0.34	0.24
		Y	0.019	0.223	0.12	0.09
		Z	0.171	0.86	0.12	0.2

Green: within specifications, red: outside specifications (ie. XY ratios above 1.5 or Z ratio above 2.0)

Lateral asymmetry ratios:

Channel	Ratio
Channel 0 (em. 525.0nm)	0.36

Channel #0

XY

YZ

XZ

| Channel 0 (em. 525.0nm)				
Sig./Backgnd ratio	LAR	Dimension	FWHM	Fit goodness
0.0	0.36	X	0.053	0.34
		Y	0.019	0.12
		Z	0.171	0.12

X profile & fitting parameters:
Fit equation I(x) = a + (b-a)*exp(-(x-c)*(x-c)/(2*d*d))
Sum of residuals squared: 24.55000
Standard deviation: 1.08123
R^2: 0.45827
Parameters:
a = 107.35000
b = 134.05501
c = 1.27323
d = 0.022330
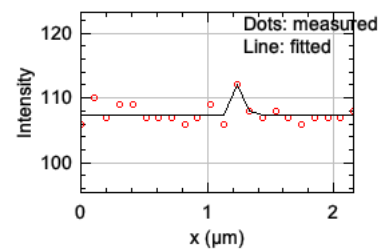

Y profile & fitting parameters:
Fit equation I(y) = a + (b-a)*eyp(-(y-c)*(y-c)/(2*d*d))
Sum of residuals squared: 49.23810
Standard deviation: 1.53123
R^2: 0.28405
Parameters:
a = 107.47619
b = 1122.06821
c = 0.69178
d = 0.0080776
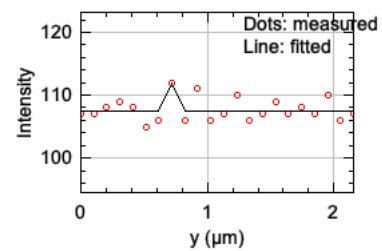

Z profile & fitting parameters:
Fit equation I(z) = a + (b-a)*ezp(-(z-c)*(z-c)/(2*d*d))
Sum of residuals squared: 252.38542
Standard deviation: 1.34267
R^2: 0.14542
Parameters:
a = 106.25790
b = 112.03666
c = 11.38982
d = 0.072639

Lateral ($res^o_{x,y}$) and axial (res^o_z) theoretical resolution values used for widefield microscopes are calculated as defined in Wilhelm, S. Confocal Laser Scanning Microscopy, 2011:

$$res^o_{x,y} = \frac{0.51*\lambda_{em}}{NA} \qquad res^o_z = \frac{1,77n*\lambda_{em}}{NA^2}$$

NA: numerical aperture, λ_{em}: emission wavelength, n: refractive index of the lens immersion & mounting media.

Axis profiles are fitted using ImageJ Gaussian Curve Fitter and the following formula $y = a + (b - a) * e^{\frac{-(x-c)^2}{2d^2}}$ (Gaussian fitting).

Measured lateral and axial resolution (Full Width at Half Maximum, FWHM) values are derived using $\text{FWHM} = 2d\sqrt{2ln(2)}$

Compliance with the Shannon-Nyquist criterion uses the following formulas for Shannon-Nyquist distances calculation:

$$\alpha = \arcsin(\frac{NA}{n})$$

$$\Delta_{x,y} = \frac{\lambda_{em}}{4.NA} \qquad \Delta_z = \frac{\lambda_{em}}{2.n.(1-cos(\alpha))}$$
